

CHANDRA X-RAY OBSERVATORY

## Cassiopeia A

Chandra has examined the Cassiopeia A supernova remnant for nearly a quarter of a century. In this image, Chandra's X-ray data (purple) have been combined with higher-energy X-rays from NuSTAR (blue), as well as infrared data from Webb (peach & green) and the now-retired Spitzer telescope. Optical data from Hubble reveals background stars in this field of view.
